

**MAS117: MATHEMATICS II**  
**2/2023 FINAL EXAMINATION**

Name ..... ID ..... Section ..... Seat No. ....

**Instructors:** Dr. Adisak Seesanea

**Date and Time:** Tuesday, May 7, 2024, 13:30-16:30 (3 hours)

**General Instructions:**

- This exam paper has 19 pages, including this page. It consists of 7 main problems with a total score of 70 points. One optional bonus problem of 10 points is provided.
- This is a closed-book exam. No calculators allowed.
- You are not allowed to be out of the examination room during the examination. Going to the restroom may result in a score deduction.
- Write your name, student ID, section, and seat number clearly on each exam sheet.
- You are supposed to complete the exam independently. Academic honesty is fundamental in this course.
- The examination paper cannot be taken out of the examination room. A violation will result in a zero score for the examination.
- Your solutions will be carefully graded based on the written methods rather than the final answers. Please make sure that your solutions are logically presented and readable.
- Your total score will be weighted to 30% of your final grade as indicated in the course syllabus.

**Problem 1. [10 points]**

Let  $f(x, y) = x^2 e^{2y}$ .

**(1a).** Find  $\nabla f$  and  $\nabla f(1, \ln 2)$ .

**(1b).** Find a unit vector  $\mathbf{u} \in \mathbb{R}^2$  in the direction in which  $f$  increases most rapidly at  $(1, \ln 2)$ . Determine the rate of change of  $f$  at  $(1, \ln 2)$  in that direction.

---

Name ..... ID ..... Section ..... Seat No. ....

(1c). Find a unit vector  $\mathbf{v} \in \mathbb{R}^2$  such that  $D_{\mathbf{v}}f(1, \ln 2) = 0$ .

(1d). Find an equation for the tangent plane and parametric equations for the normal line to the surface  $z = f(x, y)$  at the point  $(1, \ln 2, 4)$ .

---

Name ..... ID ..... Section ..... Seat No. ....

**Problem 2. [10 points]**

Given a function  $f(x, y) = 4x - 3x^3 - 2xy^2$ .

**(2a).** Compute first and second order partial derivatives of  $f$ .

**(2b).** Find the critical points of  $f$ .

---

<b>Name</b> .....	<b>ID</b> .....	<b>Section</b> .....	<b>Seat No.</b> .....
-------------------	-----------------	----------------------	-----------------------

(2c). Employ the Second Derivative Test to locate all local extrema and saddle points (if exist) of  $f$  .

---

Name .....	ID .....	Section .....	Seat No. ....
------------	----------	---------------	---------------

**Problem 3. [10 points]**

Let's say you have a plan to spend the last 24 hours before the MAS117 exam for a comprehensive study on lecture notes and final review problems. Assume the following:

- Without any preparation, you would earn 10 out of 80 points on the exam—probably from the bonus problem.
- Your exam score will increase by  $x(40 - x)$  points if you study your lecture notes for  $x$  hours; and increase by  $y(36 - y)$  points if you solve the final review problems for  $y$  hours.
- Due to exhaustion and panic, you will lose  $(x + y)^2$  points.

How many hours should you spend on studying lecture notes and final review problems in order to maximize your exam score? What is the maximum exam score you can obtain?

**Hint:** Employ the Method of Lagrange's Multiplier to optimize the score function

$$f(x, y) = 10 + x(40 - x) + y(36 - y) - (x + y)^2$$

subjects to time constraint  $g(x, y) = x + y = 24$  with  $x, y \geq 0$ .

---

**Name** ..... **ID** ..... **Section** ..... **Seat No.** .....

Name ..... ID ..... Section ..... Seat No. ....

**Problem 4. [8 points]**

Use a triple integral to find the volume of the solid  $\mathcal{G}$  that is bounded by planes

$$z = 2 - y, \quad y = 2x, \quad x = 0 \quad \text{and} \quad z = 0.$$

**Hint:** The projection of  $G$  on the  $xy$ -plane is the triangular region

$$\mathcal{D} = \{(x, y) \in \mathbb{R}^2 : 0 \leq x \leq 1 \text{ and } 2x \leq y \leq 2\}.$$

---

**Name** ..... **ID** ..... **Section** ..... **Seat No.** .....

---

Name ..... ID ..... Section ..... Seat No. ....

**Problem 5. [10 points]**

For each  $\alpha, \beta \in \mathbb{R}$ , define a vector field

$$\mathbf{F}(x, y) = (y^3 + \alpha x^2 y + 1) \mathbf{i} + (2x^3 + \beta xy^2 + 2) \mathbf{j}.$$

**(5a).** Find all the values of  $\alpha$  and  $\beta$  for which  $\mathbf{F}$  is conservative.

---

Name .....	ID .....	Section .....	Seat No. ....
------------	----------	---------------	---------------

**(5b).** For those  $\alpha$  and  $\beta$  obtained in **(5a)**, find a potential function of  $\mathbf{F}$ , that is, a function  $\phi = \phi(x, y)$  such that

$$\mathbf{F} = \nabla \phi.$$

---

Name ..... ID ..... Section ..... Seat No. ....

(5c). For those  $\alpha$  and  $\beta$  obtained in (5a), use any method to compute the line integral

$$\int_{\mathcal{C}} \mathbf{F} \cdot d\mathbf{r}$$

where  $\mathcal{C}$  is a part of the spiral described by the vector equation

$$\mathbf{r}(t) = (e^t \cos t) \mathbf{i} + (e^t \sin t) \mathbf{j} \quad \text{where } 0 \leq t \leq \pi.$$

**Hint:** Appealing to the Fundamental Theorem of Line Integrals might be helpful.

---

Name ..... ID ..... Section ..... Seat No. ....

**Problem 6. [12 points]**

**(6a).** State Green's theorem, including all hypotheses.

**(6b).** Consider the vector field

$$\mathbf{F}(x, y) = (\sin^3 x \cos x + e^x x^{55} + \pi y) \mathbf{i} + ((\pi + 1)x - 2^y y^{99}) \mathbf{j}.$$

Find  $\text{curl}_z \mathbf{F}$ , the 2-dimensional curl of  $F$ . Determine whether  $\mathbf{F}$  is conservative on  $\mathbb{R}^2$ .

Name ..... ID ..... Section ..... Seat No. ....

(6c). Let  $\mathbf{F}$  be the vector field defined in (6b). Use any method to evaluate the line integral

$$\int_{\mathcal{C}_1} \mathbf{F} \cdot d\mathbf{r}$$

where  $\mathcal{C}_1$  is a non-closed curve consists of line segments from  $A(0,0)$  to  $B(2,2)$ ,  $B(2,2)$  to  $C(2,4)$ , and  $C(2,4)$  to  $D(0,6)$ , as shown below.

**Hint:** Draw the line segment  $\mathcal{C}_2$  from  $D(0,6)$  to  $A(0,0)$ . Applying Green's Theorem for the closed curve  $\tilde{\mathcal{C}} = \mathcal{C}_1 \cup \mathcal{C}_2$  yields

$$\int_{\mathcal{C}_1} \mathbf{F} \cdot d\mathbf{r} + \int_{\mathcal{C}_2} \mathbf{F} \cdot d\mathbf{r} = \oint_{\tilde{\mathcal{C}}} \mathbf{F} \cdot d\mathbf{r} = \iint_{\mathcal{D}} \text{curl}_z \mathbf{F} \, dA,$$

where  $\mathcal{D}$  is the trapezoidal region enclosed by  $\tilde{\mathcal{C}}$ .

------------	----------	---------------	---------------

**Problem 7. [10 points]**

A *curved lamina* is an idealized object that is thin enough to be viewed as a surface in 3-space. Let us consider a curved lamina  $\sigma$  which is a part of an elliptic paraboloid

$$z = 16 - x^2 - y^2$$

between the planes  $z = 7$  and  $z = 12$ . Denoted by  $\mathcal{R}$  the projection of  $\sigma$  on the  $xy$ -plane.

**(7a).** Sketch the curved lamina  $\sigma$  and its projection  $\mathcal{R}$ .

---

Name ..... ID ..... Section ..... Seat No. ....
---

(7b). Suppose  $\sigma$  has density (mass per unit area)

$$f(x, y, z) = \frac{x^2}{16 - z}.$$

Compute the mass of this lamina by using a surface integral.

**Hint:** Given  $z = g(x, y)$ , one has

$$\iint_{\sigma} f(x, y, z) \, dS = \iint_{\mathcal{R}} f(x, y, g(x, y)) \sqrt{z_x^2 + z_y^2 + 1} \, dA.$$

Converting the double integral into polar coordinates might be helpful. Also, recall that  $\cos^2 \theta = \frac{1}{2}(1 + \cos 2\theta)$ .

Name ..... ID ..... Section ..... Seat No. ....

**Bonus Problem. [10 points]**

Determine whether the statement is true or false. Circle your answer for each statement. No justification is required.

- (8a). The directional derivative of  $f(x, y)$  at  $(x_0, y_0)$  in the direction of  $\mathbf{u} = \langle 0, e^2 - 1 \rangle$  coincides with the partial derivative  $f_y(x_0, y_0)$ .

TRUE

FALSE

- (8b). If  $f(x, y)$  is continuous on the ring

$$\mathcal{R} = \{(x, y) \in \mathbb{R}^2 : \pi \leq x^2 + y^2 \leq 2\pi\},$$

then  $f$  must have both global maximum and minimum on  $\mathcal{R}$ .

TRUE

FALSE

- (8c). For any continuous functions  $g = g(x, y)$ , one has  $\int_0^1 \int_0^x g(x, y) dy dx = \int_0^x \int_0^1 g(x, y) dx dy$ .

TRUE

FALSE

- (8d). If  $\mathcal{C}$  is a smooth curve in  $\mathbb{R}^2$  and  $f(x, y)$  is a continuous function defined on  $\mathcal{C}$ , then

$$\int_{\mathcal{C}} f(x, y) ds = - \int_{-\mathcal{C}} f(x, y) ds.$$

TRUE

FALSE

- (8e). Given a vector field  $\mathbf{F}(x, y) = f(x, y)\mathbf{i} + g(x, y)\mathbf{j}$  whose components  $f$  and  $g$  have continuous first derivatives on region  $\mathcal{D} = \{(x, y) \in \mathbb{R}^2 : (x, y) \neq (0, 0)\}$ . If  $f_y = g_x$  on  $\mathcal{D}$ , then  $\mathbf{F}$  must be conservative on  $\mathcal{D}$ .

TRUE

FALSE

**Hint:**
